# 16-1 The Nature of the Equilibrium State

In a closed reaction vessel at constant temperature, a reaction proceeds spontaneously toward equilibrium. At equilibrium, the reaction quotient Q attains the same constant value, K, irrespective of the starting amounts of reactants and products.

#### $2 \operatorname{Cu}^{2+}(aq) + \operatorname{Sn}^{2+}(aq) \implies 2 \operatorname{Cu}^{+}(aq) + \operatorname{Sn}^{4+}(aq) \quad (16.1)$

#### Table 16.1Activities of Some Substances

| Substance  | Activity <sup>a</sup> | Comment  |
|--|-----------------------|--|
| Ideal gas, X(g)                                  | $a = P_X/P^\circ$     | $P_{\chi}$ is the partial pressure of the gas and<br>$P^{\circ} = 1$ bar $\approx 1$ atm. When pressure is<br>expressed in bar, the activity is equal to<br>the numerical value of the pressure. |
| Pure solid or liquid,<br>X(s) or X(l)            | a = 1                 | For pressures normally encountered, <sup>b</sup> the activity of a pure solid (or a pure liquid) is equal to 1.  |
| Solute in an ideal<br>aqueous solution,<br>X(aq) | a = [X]/c°            | [X] is the concentration in mol/L and $c^{\circ} = 1 \text{ mol/L}$ . When concentration is expressed in mol/L, the activity of a dissolved solute is equal to the numerical value of [X].       |

<sup>a</sup>To incorporate deviations from ideal behavior, we would write  $a = \gamma P_X / P^\circ$  for a gas and  $a = \gamma [X] / c^\circ$  for a solute in aqueous solution, where  $\gamma$  is an experimentally determined correction factor called the *activity coefficient*. More advanced treatments of this topic show how  $\gamma$  is related to the composition of the system. <sup>b</sup>See Exercise 97.

#### $2 \operatorname{Cu}^{2+}(\operatorname{aq}) + \operatorname{Sn}^{2+}(\operatorname{aq}) \implies 2 \operatorname{Cu}^{+}(\operatorname{aq}) + \operatorname{Sn}^{4+}(\operatorname{aq}) \quad (16.1)$

$$Q = \frac{a_{Cu^+}^2 \times a_{Sn^{4+}}}{a_{Cu^{2+}}^2 \times a_{Sn^{2+}}}$$
(16.2)

$$Q = \frac{a_{Cu^{+}}^{2} \times a_{Sn^{4+}}}{a_{Cu^{2+}}^{2} \times a_{Sn^{2+}}^{2}} = \frac{([Cu^{+}]/c^{\circ})^{2} \times ([Sn^{4+}]/c^{\circ})}{([Cu^{2+}]/c^{\circ}) \times ([Sn^{2+}]/c^{\circ})} = \frac{[Cu^{+}]^{2}[Sn^{4+}]}{[Cu^{2+}][Sn^{2+}]}$$

(16.3)

| Equilibrium  | 0.0922                                     | 0.0961                              | 0.1078         | 0.1039              | $\frac{(0.1078)^2 (0.1039)}{(0.0922)^2 (0.0961)} = 1.48$     |

<sup>a</sup>Strictly speaking, we cannot evaluate Q in this case. Any value divided by zero is undefined. By writing  $Q = \infty$ , we mean that as [Cu<sup>2+</sup>] and [Sn<sup>2+</sup>] approach zero, the value of Q approaches infinity.

- 1. The reaction quotient Q has the same value at equilibrium no matter what the starting concentrations are.
- 2. The equilibrium value of Q is represented by the symbol K and is called the equilibrium constant

FIGURE 16-1 Three approaches to equilibrium in the reaction  $2 Cu^{2+}(aq) + Sn^{2+}(aq) \implies 2 Cu^{+}(aq) + Sn^{4+}(aq)$ 

# The Dynamic Nature of the Equilibrium Condition

The equilibrium condition is dynamic, with the forward and reverse reactions occurring not only indefinitely but also at exactly the same rate.

 $AgI(s) \iff Ag^{+}(aq) + I^{-}(aq)$ 

(b)

▲ FIGURE 16-2 Dynamic equilibrium illustrated

$$aA + bB + \dots \iff cC + dD + \dots$$
 (16.4)

$$Q = \frac{a_C^c \times a_D^d \times \dots}{a_A^a \times a_B^b \times \dots}$$
(16.5)

$$K = \frac{a_{C,eq}^{c} \times a_{D,eq}^{d} \times \dots}{a_{A,eq}^{a} \times a_{B,eq}^{b} \times \dots}$$
(16.6)

$$K = \frac{a_C^c \times a_D^d \dots}{a_A^a \times a_B^b \dots}$$
(16.7)

in 16.7, equilibrium values of *a* are implied

#### Equilibria Involving Gases

$$K = \frac{(P_C / P^{\circ})^c (P_D / P^{\circ})^d \dots}{(P_A / P^{\circ})^a (P_B / P^{\circ})^b \dots} = \frac{P_C^c \times P_D^d \dots}{P_A^a \times P_B^b \dots} \times \left(\frac{1}{P^{\circ}}\right)^{\Delta \upsilon} (16.8)$$
$$\Delta \upsilon = (c + d + \dots) - (a + b + \dots)$$

The sum of coefficients for the products The sum of coefficients for the reactants

$$K_{P} = \frac{P_{C}^{c} \times P_{D}^{d}}{P_{A}^{a} \times P_{B}^{b}}.$$
(16.9)

$$K = K_P \times \left(\frac{1}{P^{\circ}}\right)^{\Delta \nu} \tag{16.10}$$

#### Equilibria in Aqueous Solution

$$K = \frac{([C]/c^{\circ})^{c}([D]/c^{\circ})^{d}...}{([A]/c^{\circ})^{a}([B]/c^{\circ})^{b}...} = \frac{[C]^{c} \times [D]^{d}...}{[A]^{a} \times [B]^{b}...} \times \left(\frac{1}{c^{\circ}}\right)^{\Delta v}$$
(16.11)

$$K_{c} = \frac{[C]^{c} \times [D]^{d} \dots}{[A]^{a} \times [B]^{b} \dots}$$
(16.12)

$$K = K_c \times \left(\frac{1}{c^{\circ}}\right)^{\Delta \nu} \tag{16.13}$$

### Equilibria Involving Pure Liquids and Solids

 $2 \operatorname{Al}(s) + 6 \operatorname{H}^{+}(aq) \implies 2 \operatorname{Al}^{3+}(aq) + 2 \operatorname{H}_{2}(g)$ 

Pure solids and liquids are not included in equilibrium constant expressions

Recall from Chapter 13

$$K = \frac{(a_{Al^{3+},eq})^2 (a_{H_2,eq})^3}{(a_{Al,eq})^2 (a_{H^+,eq})^6} \approx \frac{([Al^{3+}]_{eq}/c^{\circ})^2 (P_{H_2,eq}/P^{\circ})^3}{(1)^2 ([H^+]_{eq}/c^{\circ})^6}$$
$$= \frac{[Al^{3+}]_{eq}^2 (P_{H_2})^3}{[H^+]_{eq}^6} \times (c^{\circ})^4 \times \left(\frac{1}{P^{\circ}}\right)^3$$

FIGURE 16-3 Equilibrium in the reaction  $CaCO_3(s) \iff CaO(s) + CO_2(g)$ 

#### $C(s) + H_2O(g) \iff CO(g) + H_2(g)$

$$K = \frac{a_{CO(g)}a_{H_2(g)}}{a_{C(s)}a_{H_2O(g)}} = \frac{(P_{CO(g)}/P^{\circ})(P_{H_2(g)}/P^{\circ})}{(1)(P_{H_2O(g)}/P^{\circ})}$$

$$= \frac{P_{CO(g)}P_{H_2(g)}}{P_{H_2O(g)}} \times \frac{1}{P^{\circ}} = K_P \times \left(\frac{1}{P^{\circ}}\right)$$

#### $CaCO_3(s) \iff CaO(s) + CO_2(g)$

$$K = \frac{a_{CO_2(g)} a_{CaO(s)}}{a_{CaCO_3(s)}} = \frac{(P_{CO_2(g)} / P^{\circ})(1)}{(1)}$$
$$= P_{CO(g)} \times \left(\frac{1}{P^{\circ}}\right) = K_P \times \left(\frac{1}{P^{\circ}}\right)$$

16-3 Relationships Involving the Equilibrium Constant Relationship of K to the Balanced Chemical Equation

- When we *reverse* an equation, we *invert* the value of *K*.
- When we *multiply* the coefficients in a balanced equation by a common factor we raise the equilibrium constant to the *corresponding power*.
- When we *divide* the coefficients in a balanced equation by a common factor we take the *corresponding root* of the equilibrium constant.

### **Combining Equilibrium Constant Expressions**

 $N_2O(g) + \frac{1}{2}O_2(g) \rightleftharpoons 2 NO(g) \quad K_c = ?$ 

 $N_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons N_2O(g) \qquad K = 5.4 \times 10^{-19}$  (16.15)

 $N_2(g) + O_2(g) \implies 2 NO(g) \quad K_{c(3)} = 4.6 \times 10^{-31}$  (16.16)

$$N_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons N_2O(g) \quad K = 5.4 \times 10^{-19}$$
 (16.15)

(a)  $N_2(g) + \frac{1}{2}O_2(g) \rightleftharpoons N_2O(g) \qquad K_{(a)} = \frac{1}{5}.4 \times 10^{-19} = 1.9 \times 10^{18} \qquad (16.15) \times (-1)$ 

(b)  $N_2(g) + O_2(g) \implies 2 \operatorname{NO}(g) \quad K_{(b)} = 4.6 \times 10^{-31}$  (16.16)

Overall:  $N_2O(g) + \frac{1}{2}O_2(g) \rightleftharpoons 2 NO(g) \quad K_{overall} = ?$ 

$$K(overall) = \frac{a_{NO(g)}^2}{a_{N_2O(g)}^2 a_{O_2(g)}^{\frac{1}{2}}} = \frac{a_{N_2(g)}^2 a_{O_2(g)}^{\frac{1}{2}}}{a_{N_2O(g)}^2} \times \frac{a_{NO(g)}^2}{a_{N_2(g)}^2 a_{O_2(g)}} = K_{(a)} \times K_{(b)}$$

 $= 1.9 \times 10^{18} \times 4.6 \times 10^{-31} = 8.5 \times 10^{-13}$ 

### Relationship Between $K_P$ and $K_c$ for Reactions Involving Gases

$$P_A = \frac{n_A RT}{V} = [A]RT$$

$$K_{P} = \frac{P_{C}^{c} \times P_{D}^{d}..}{P_{A}^{a} \times P_{B}^{b}..} = \frac{([C]RT)^{c}([D]RT)^{d}...}{([A]RT)^{a}([B]RT)^{b}...} = \frac{[C]^{c} \times [D]^{d}...}{[A]^{a} \times [B]^{b}...} \times (RT)^{\Delta v_{gas}}$$

$$K_P = K_c \times (RT)^{\Delta v_{gas}} \tag{16.17}$$

# 16-4 The Magnitude of the Equilibrium Constant.

A very large value of K signifies that the reaction, as written, exhibits a strong tendency to go to completion. An equilibrium mixture contains about as much product as can be formed from the given initial amounts of reactants.

A very small value of K signifies that the reaction, as written, exhibits very little tendency to occur. An equilibrium mixture contains reactants, in essentially their initial amounts, and very small amounts of products.

| Table 16.3                                    | Equilibrium Constants of Some Common Reactions |   |  |  |  |
|---|--|---|--|--|--|
| Reaction                                      |  | Equilibrium Constant, K                                 |  |  |  |
| $2 H_2(g) + O_2$                              | $(g) \Longrightarrow 2 H_2O(l)$                | $1.4	imes10^{83}$ at 298 K                              |  |  |  |
| $CaCO_3(s) =$                                 | $\Rightarrow$ CaO(s) + CO <sub>2</sub> (g)     | 1.9 × 10 <sup>–23</sup> at 298 K<br>1.0 at about 1200 K |  |  |  |

$$2 \operatorname{Cu}^{2+}(\operatorname{aq}) + \operatorname{Sn}^{2+}(\operatorname{aq}) \implies 2 \operatorname{Cu}^{+}(\operatorname{aq}) + \operatorname{Sn}^{4+}(\operatorname{aq}) \quad (16.1)$$
$$Q = \frac{[Cu^{+}]^{2}[Sn^{4+}]}{[Cu^{2+}][Sn^{2+}]} \qquad K = 1.48$$

KAIST CHEMTS

# 16-6 Altering Equilibrium Conditions: Le Châtelier's Principle

When an equilibrium system is subjected to a change in temperature, pressure, or concentration of a reacting species, the system responds by attaining a new equilibrium that partially offsets the impact of the change.

# Effect of Changing the Amounts of Reacting Species on Equilibrium

 $2 \operatorname{SO}_2(g) + \operatorname{O}_2(g) \rightleftharpoons 2 \operatorname{SO}_3\operatorname{O}(g) \quad K_c = 2.8 \times 10^2 \text{ at } 1000 \text{ K}$ 

Let's consider the following reaction

 $2 \text{ SO}_2(g) + \text{O}_2(g) \Longrightarrow 2 \text{ SO}_3(g)$   $K_c = 2.8 \times 10^2 \text{ at } 1000 \text{ K}$ 

FIGURE 16-5 Changing equilibrium conditions by changing the amount of a reacting species  $2 SO_2(g) + O_2(g) \iff 2 SO_3(g), K_c = 2.8 \times 10^2 \text{ at } 1000 \text{ K}$  Original equilibrium Immediately following disturbance

$$Q = \frac{[SO_3]^2}{[SO_2]^2[O_2]} = K_c$$

$$Q > K_{\rm c}$$

$$2 \operatorname{SO}_2(g) + \operatorname{O}_2(g) \underset{k_{-1}}{\overset{k_1}{\longleftarrow}} 2 \operatorname{SO}_3(g)$$

# Effect of Changes in Pressure or Volume on Equilibrium

- 1. Add or remove a gaseous reactant or product. Changes  $P_{\text{gas}}$ .
- 2. Adding an inert gas to the constant volume reaction mixture.

Relative partial pressures are unchanged.

3. Change the pressure by changing the volume of the system.

#### $2 \operatorname{SO}_2(g) + \operatorname{O}_2(g) \rightleftharpoons 2 \operatorname{SO}_3\operatorname{O}(g) \quad K_c = 2.8 \times 10^2 \text{ at } 1000 \text{ K}$

$$K_{\rm c} = \frac{[{\rm SO}_3]}{[{\rm SO}_2]^2[{\rm O}_2]} = \frac{\left(\frac{n_{\rm SO}_3}{V}\right)^2}{\left(\frac{n_{\rm SO}_2}{V}\right)^2 \frac{n_{\rm O}_2}{V}} = \frac{n_{\rm SO}_3^2}{n_{\rm SO}_2^2 n_{\rm O}_2} V$$

If V is reduced by a factor of 10, then  $\frac{1}{n_{\rm S}}$ increase by a factor of 10  $n_{\rm S}$ 

FIGURE 16-6 Effect of a pressure change on equilibrium in the reaction  $2 SO_2(g) + O_2(g) \implies 2 SO_3(g)$ 

When the volume of an equilibrium mixture of gases is reduced, a net change occurs in the direction that produces fewer moles of gas. When the volume is increased, a net change occurs in the direction that produces more moles of gas.

# Effect of Temperature on Equilibrium

*Raising the temperature* of an equilibrium mixture shifts the equilibrium condition in the direction of the *endothermic* reaction. *Lowering the temperature* causes a shift in the direction of the *exothermic* reaction.

For *endothermic* reactions, *K increases* as temperature increases. For *exothermic* reactions, *K decreases* as temperature increases.

### Effect of a Catalyst on Equilibrium

A catalyst has no effect on the condition of equilibrium in a reversible reaction.

▲ Sulfuric acid is produced from SO<sub>3</sub> SO<sub>3</sub>(g) + H<sub>2</sub>O(I)  $\iff$  H<sub>2</sub>SO<sub>4</sub>(aq)

# 16-7 Equilibrium Calculations: Some Illustrative Examples.

Five numerical examples are given in the text that illustrate ideas that have been presented in this chapter.

Refer to the "comments" which describe the methodology. These will help in subsequent chapters.

Exercise your understanding by working through the examples with a pencil and paper.
